

Work Smarter ... Not harder

Work simplification is a very effective tool used to identify waste and non-value added tasks performed in a work process.

This may include: excess travel, bending, reaching, lifting, sharing tools and or equipment, looking, poor work instructions, trying to operate equipment that is not up to par or suited for the task or not using known best practices to perform the necessary work.

Fixing these types of situations typically does not cost a lot of time or money. They just need time, attention and corrective action. Call us to learn more.

We can provide the building blocks of simplified work flow

W

We specialize in process improvements such as Kaizen Events that typically do not require a large capital investment for a company to realize significant benefits.

O

Our approach applies to any work process in manufacturing, warehousing, distribution, maintenance, production planning and scheduling as well as preparing work to go to the shop floor.

R

Review and observe the major work processes to identify and quantify the impact of downtime, work process bottlenecks, non-value added tasks performed, waste of materials and time as well as information gaps.

K

Know and understand the work processes and the expected performance to identify “root problem causes” and to develop a corrective action plan.
